MCLEAN, NEIL R

ART UNIT

PAPER NUMBER

2625

MAIL DATE

DELIVERY MODE

11/27/2007

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/616,324	Applicant(s) KISHIGAMI, TAKASHI	
	Examiner Neil R. McLean	Art Unit 2625	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 19 September 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) 3-20 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1 and 2 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 18 July 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Election/Restrictions

1. Claim 3-20 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected Species, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on 9/19/2007
2. Applicant's election with traverse of Election/Restriction in the reply filed on 9/19/2007 is acknowledged. The traversal is on the ground(s) that the pending claims do not present a serious burden to the Examiner, and that the inventions as claimed are not independent or distinct. This is not found persuasive because the reference searched and used to reject Claims 1 and 2 (Applicant elected Species I, Page 3, in Applicants response filed on 9/19/2007) cannot be used to reject other claims in the non elected species. The Examiner will need to conduct a separate search for these claims, therefore it would present a serious burden to the Examiner.
3. 806.04(e) Claims Limited to Species [R-5]

Claims are definitions >or descriptions< of inventions. *Claims >themselves< are never species.* The scope of a claim may be limited to a single disclosed embodiment (i.e., a single species, and thus be designated a *specific species claim*)*>. Alternatively,< a claim may *>encompass< two or more of the disclosed embodiments** (and thus be designated a *generic or genus claim*).

*Species * always >refer to< the * different embodiments >of the invention<.*

Applicant's specification on Page 5 clearly defines the invention as First Embodiment, and on Page 17, Modification of First Embodiment and on Page 18 Second Embodiment and the limitations pointed out by the Examiner in the Restriction Requirement. For example, the limitation in described in Figures 1 and 2 in the First embodiment are not disclosed in the Second embodiment, and the limitation described in Figures 7 and 8 in the Second embodiment are not in the First embodiment.

The requirement is still deemed proper and is therefore made FINAL.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claim 1 rejected under 35 U.S.C. 102(e) as being anticipated by Tokura (US 2002/0041392).

Regarding Claim 1:

Tokura discloses an image forming system ([0023]; lines 4-7), comprising a computer (e.g., 150 in Figure 1), a first image forming apparatus capable of performing only monochrome printing (The printer in Figure 1 which performs monochrome

printing), and a second image forming apparatus capable of performing color printing (The printer in Figure 1 which performs color printing), which are connected with each other via a network (140 in Figure 1), wherein said computer has:

(a) a page-number appending function of appending page numbers onto job data (The portion of the print server 100 in Figure 1 which appends page numbers as shown for example in Figures 7A-7C; [0019]; lines 1-4),

(b) a job-data dividing function of dividing said job data into monochromatic print data and color print data ([0037]; lines 1-6),

(c) a job-data allocating function of allocating said monochromatic print job data and color print job data divided through said job-data dividing function, respectively, to said first image forming apparatus and said second image forming apparatus ([0025]; lines 1-9), and

(d) a data-transmitting/receiving function of transmitting said monochromatic print job data to said first image forming apparatus via said network, and transmitting said color print job data to said second image forming apparatus via said network ([0031]; lines 3-7) in response to reception of a job-process-continuation signal from said second image forming apparatus after receiving a job-completion signal from said first image forming apparatus (Page 5, Column 2, Claim 5,), said first image forming apparatus includes:

(a) first image formation means for forming a monochrome image on each of first recording materials in accordance with said monochromatic print job data transmitted

from said computer (Figure 2 is a block diagram showing a detailed construction of the image processing apparatus),

(b) job-completion detection means for detecting completion of said monochromatic print job and then outputting said job-completion signal to said computer (Figure 10 shows the operation of the print server), and

(c) first communication means for allowing data communication with said computer via said network (Print Server 100 in Figure 1), said second image forming apparatus includes:

(a) second image formation means for forming a color image on each of second recording materials in order of page number in accordance with said color print job data transmitted from said computer (Figure 2 is a block diagram showing a detailed construction of the image processing apparatus),

(b) recording-material feed means for feeding said second recording materials to said second image formation means (See Step 507 and S508 in Figure 5),

(c) a post-processing device having a post-processing section with a post-processing tray, and a first discharge section, wherein said post-processing section is adapted to guide said second recording materials fed from said recording-material feed means and color-printed by said second image formation means, to said post-processing tray, so as to subject said second recording materials on said post-processing tray to a post-processing and then discharge said second recording materials from said post-processing tray onto a recording-material discharge tray, and said first discharge section is adapted to discharge said second recording materials fed

from said recording-material feed means and color-printed by said second image formation means, directly onto said recording-material discharge tray (Page 5, Column 2, Claim 5),

(d) job-process-continuation-signal input means for entering said job-process-continuation signal therethrough, wherein said job-process-continuation-signal input means is adapted to allow said job-process-continuation signal to be output to said computer only after said first recording materials with monochrome images formed by said first image forming apparatus are set on said post-processing tray of said post-processing device (See Step 507 and S508 in Figure 5),

(e) second communication means for allowing data communication with said computer via said network (Print Server 100 in Figure 1), and

(f) image-formation control means for controlling respective operations of said second image formation means, said recording-material feed means, said post-processing device, said job-process-continuation-signal input means and said second communication means (Print server 100 in Figure 1), and said image-formation control means has:

(1) a function of switching an operation of said post-processing device in such a manner that in response to said job-process-continuation signal entered from said job-process-continuation-signal input means, said second recording materials color-printed by said second image formation means are discharged directly onto said recording-material discharge tray through said first discharge section, and said post-processing section serving as a second discharge section to discharge said first recording materials

set on said post-processing tray, onto said recording-material discharge tray without subjecting said first recording materials set on said post-processing tray to said post-processing (Page 5, Column 2, Claim 5), and

(2) a recording-material mixing function of checking said page numbers of said color print job data transmitted from said computer (e.g., sorting function in Figure 4), and switching respective operations of said recording-material feed means and said post-processing means to allow color pages and monochrome pages to be mixed together while serializing their page numbers in a sequential order ([0038]).

Regarding Claim 2:

An image forming system ([0023]; lines 41-7) comprising a plurality of image forming apparatuses (e.g., 120's in Figure 1) and a computer (e.g., 150 in Figure 1), which are connected with each other via a network (140 in Figure 1), wherein each of said image forming apparatuses is adapted to be operated in accordance with job data from said computer, wherein said computer has:

(a) a page-number appending function of appending page numbers onto said job data (The portion of the print server 100 in Figure 1 which appends page numbers as shown for example in Figures 7A-7C; [0019]; lines 1-4),

(b) a job-data dividing function of dividing said job data in accordance with a given dividing rule ([0037]; lines 1-6),

(c) a job-data allocating function of allocating plural job data divided through said job-data dividing function, respectively, to specified image forming apparatuses ([0025]; lines 1-9), and

(d) a data-transmitting/receiving function of transmitting said plural job data allocated through said job-data allocating function, to said corresponding image forming apparatuses via said network ([0031]; lines 3-7), at least one of said image forming apparatuses includes:

(a) image formation means for forming an image on each of first recording materials in order of page number in accordance with said job data transmitted from said computer (Figure 2 is a block diagram showing a detailed construction of the image processing apparatus),

(b) recording-material feed means for feeding said first recording materials to said image formation means (See Step 507 and S508 in Figure 5),

(c) a post-processing device having a post-processing section with a post-processing tray, and a first discharge section, wherein said post-processing section is adapted to guide said first recording materials fed from said recording-material feed means and formed with images, to said post-processing tray, so as to subject said first recording materials on said post-processing tray to a post-processing and then discharge said first recording materials from said post-processing tray onto a recording-material discharge tray, and said first discharge section is adapted to discharge said first recording materials fed from said recording-material feed means and formed with

images, directly onto said recording-material discharge tray (Page 5, Column 2, Claim 5),

(d) job-process-continuation-signal input means for entering a job-process-continuation-signal therethrough, wherein said job-process-continuation-signal input means is adapted to allow said job-process-continuation signal to be output to said computer only after second recording materials with images formed by another one of said image forming apparatuses are set on said post-processing tray of said post-processing device (See Step 507 and S508 in Figure 5),

(e) communication means for allowing data communication with said computer via said network (Print Server 100 in Figure 1), and

(f) image-formation control means for controlling respective operations of said image formation means, said recording-material feed means, said post-processing device, said job-process-continuation-signal input means and said communication means (Print server 100 in Figure 1), and said image-formation control means has:

(1) a function of switching an operation of said post-processing device in such a manner that in response to said job-process-continuation signal entered from said job-process-continuation-signal input means, said first recording materials with images formed by said image formation means are discharged directly onto said recording-material discharge tray through said first discharge section, and said post-processing section serves as a second discharge section to discharge said second recording materials from said post-processing tray onto said recording-material discharge tray

without subjecting said second recording materials set on said post-processing tray to said post-processing (Page 5, Column 2, Claim 5), and

(2) a recording-material mixing function of checking said page numbers of said job data transmitted from said computer (e.g., sorting function in Figure 4), and switching said respective operations of said recording-material feed means and said post-processing device to allow said second recording materials with images formed by said another image forming apparatus and said first recording materials with images formed by said image formation means to be mixed together while serializing their page numbers in a sequential order ([0038]).

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Kato (US 6,738,151) discloses a distributed processing server capable of applying distributed processing on one job which is inputted from a client and consists of a plurality of pages by at least two image recording apparatuses.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Neil R. McLean whose telephone number is 571.

270.1679. The examiner can normally be reached on Monday through Friday 7:30AM-5:00PM EST.
